

ABSTRACT OF THE DISCLOSURE

A method and a system for matching medical condition information with medical resources are provided. Specifically, a plurality of medical resources such as, for example, practitioners, specialists, specialty hospitals, or any other medical or extended care providers may have information related thereto stored within a database on a computer network. The information may include information on specific medical conditions, such as, for example, diseases, disorders, or any other medical condition. Alternatively, the medical resource may include information on specific medical procedures in which the medical resource may have a specialty or may otherwise perform. An individual may access a website connected with the database and may enter information on medical conditions and/or medical procedures. A search of the database may then reveal specific medical resource categories and, thence, medical resources that may treat the medical condition or may perform the medical procedures chosen by the individual.
